Acknowledgements

We would like to express our sincere thanks to our supervisor Dr. Ghamz e Ali Siyal, Professor from Economics department at Institute of Business administration (IBA), Karachi for his guidance, support and valuable feedback in the process of developing this research. These observations guided us in improving our study and brought us a good focus and purpose in our approach to the work.

The teachers, peers and everyone involved in our learning and research are also appreciated. We have gained more confidence in our knowledge of the subject through their suggestions, discussions and encouragement.

Lastly, we would like to thank our families for their continued support, patience, and encouragement during the course of this dissertation. We are only just finishing this journey and their faith in us was a significant motivator.

Abstract

The aim of this research is to analyze changes in public sentiment in the form of patriotic songs during periods of macroeconomic uncertainty. Our aim is to achieve the same goal (i.e. linking words with themes in the songs) by using a lexicon-based approach first by constructing an Urdu word dictionary and then by linking the word to themes in the songs. The results indicate that the themes of national unity, state legitimacy and military defense are significant during periods of economic growth, which are revealed by an increase in GDP. But there is no significant difference between unemployment and inflation in most themes. A larger sample of countries reveals a positive link between democracy and state legitimacy. The study demonstrates that the patriotic song, like any cultural or artistic creation, is, at the same time, a measurable indicator of the national mood, of political legitimation, of the experience and history of the national economy in a given time.

1 Introduction

Culture is a living record for society, storing the feelings, identities, and reactions for society to record the effects and responses for historical and economic changes. Music is helpful in documenting this because of its lyrical contents. It is a window to self-identity and constructs of society. It is also measurable (Brandellero & Janssen, 2014). In recent decades, researchers have begun viewing music as an economic and social expression and data on identity, memory and political behavior (Pettijohn & Sacco, 2009). Unlike the existing research which lacked studying the songs and the social and political responses to the evolving economic conditions, this research attempts to study this relationship.

In this research, the focus is on the relationship of the sentiments of patriotic songs and the certain chosen economic indicators. It is hypothesized that if the economic condition of a nation alters how a society lives, then these economic conditions also influence the way a society culturally expresses itself. In prosperous economic times, songs are likely to be expressive of forward-looking, optimistic sentiments. In less prosperous times, the songs are likely to be dominated by the sentiments of courage, sacrifice, unity and rebirth of ideological expressions.

To examine this, the paper collects a dataset of patriotic songs drawn from Pakistan's post-independence history up to the present. For each song, a lexicon-based tagging method was used to assign each word to one of the following categories: National Unity & Social Cohesion, State Legitimacy & Political Ideology, Military Defense & Martyrdom, Economic Progress & Resource Wealth, Economic Sacrifice & Resilience, Future Outlook & Youth, and Global Identity & Diaspora. The results were used to create a coded thematic profile for each song which could then be compared to available economic data.

Patriotic songs are chosen for this study because most of the songs were created by Inter-Services Public Relations (ISPR) and used to create a sense of national unity especially during the time of economic pressure in Pakistan. As Abid, Bilal and Begum (2022) show, Pakistani music often speaks to political, and emotional needs. Likewise, in a similar vein, Shiller (2019) maintains that during times of economic hardship, governments tell themselves and the public optimistic cultural tales to manipulate public sentiment. ISPR songs in Pakistan are a part of the official communication policy and have themes of national unity, military, sacrifice, war, public sentiments towards the nation, etc. (Saeed, Bukhari & Rasool, 2020). As such, these songs are important for this study as patriotism reflects national narratives, which foster emotional links with the nation.

This study also discusses the ISPR songs as cultural communication of the state. These songs are patriotic, enjoyable and have messages of national unity, sacrifice, loyalty and the part played by the military in the defense of the nation. ISPR uses music as a medium to represent the military as the mainstay of national security and collective identity. The songs can therefore be interpreted as subtle propaganda as the political and national messages are carried by emotion, culture and memory, rather than by direct political speech. This is crucial because music can help to create images of the country, to remember wars and to connect with the state. Hence, ISPR songs serve as an interesting example for analysis of the potential of cultural expression in reinforcing narratives of the nation and shaping public perception of the military and national life.

On methodology, the study takes an econometric approach. Thematic word frequencies are treated as the outcomes being measured, while macroeconomic indicators serve as explanatory variables. This structure allows for a clear analysis of how shifts in economic conditions influence the public sentiment. Combining Lexicon-based sentiment analysis with macroeconomic modelling in this

way is rare. That combination is what allows this paper to move beyond a snapshot of sentiment and instead trace how economic reality and cultural production interact over time.

This study adds to the discussions in multiple fields of economics, culture, ethnomusicology, and data science by demonstrating how music relates to social and economic changes. Music extends beyond the representation of national identity. Music is dynamic, like the conditions and identity it seeks to represent. This is especially the case for patriotic songs. These songs are loaded politically and are not artifacts for easy consumption. They change politically across space and time and manifest different meanings in the contexts in which the songs are heard (Bohlman, 2004). This study relies on different techniques to capture the music of different times to offer different meanings. In doing so, it helps provide evidence to the political music narrative of nations.

2 Literature review

This literature review delves into the growing field of ethnomusicology and economics that have started to treat song content as quantitative evidence about culture, identity, and public sentiment. By investigating patriotic songs this review aims to establish a comprehensive understanding of how music shapes national narratives, develops patriotic feeling and strengthens nationalism, it examines how ISPR songs use repeated themes such as unity, sacrifice, war, military service, and loyalty to the country to create an emotional connection between citizens, the nation, and the armed forces. The literature indicates that music is not just entertainment, but also a cultural bearer, a transmitter of messages and stories which make it natural records of a society's collective experiences. To be more specific, Shiller (2019) shows that economic ideas spread through stories, and music is one of the powerful ways to share those stories. Akerlof and Kranton (2000) also emphasize that identity, formed through common cultural expression like song, influences economic behavior, not just a side factor. People listen to music that suits their moods, and by doing so, they absorb and convey the stories in the lyrics.

When economies fall into distress, consumer behavior towards buying changes. The lipstick effect, documented by Hill et al. (2012) and then later tested by Bracha and Tang (2016), refers to the phenomenon where, during economic downturns people reduce spending on expensive items but still buy smaller affordable luxuries, instead of eliminating spending. Music listening is the most extreme version of this; it is cheap and boosts morale. In fact, music has been the most universally reported mood regulation strategy across cultures (Thayer, Newman, McClain, 1994) and people make a conscious effort to use music to improve their mood during moments of stress and anxiety (Hargreaves, 2004). There has been extensive research showing that economic factors directly influence music listening. Ferreira and Waldfogel (2013) find, at the international level, that

income and music consumption are correlated and a wide literature exists documenting the connection between state of the economy and emotionally intense music charts.

Several studies have applied natural language processing to song lyrics in order to examine sentiment. Rahman et al. (2024) applied unsupervised machine learning techniques, such as Non-Negative Matrix Factorization, Latent Semantic Analysis, and Latent Dirichlet Allocation, to a corpus of Pakistani Coke Studio songs, identifying main themes: devotion, longing, and celebration. Their findings showed that NMF with six topics produced the highest coherence score of 0.41, suggesting that stable themes exist in song lyrics rather than being categorized by researchers. Napier and Shamir (2018) did textual analysis to track political and social messages in American song lyrics over several decades. Their results showed that lyrics often reflect changes in society. More recent research has extended lyrical analysis to Billboard chart songs; for example, DeWall et al. (2011) analyzed Billboard chart lyrics from 1980 to 2007 using linguistic marker analysis. They found shifts in themes such as loneliness, hostility, and self-focus, reflecting social psychology at the time.

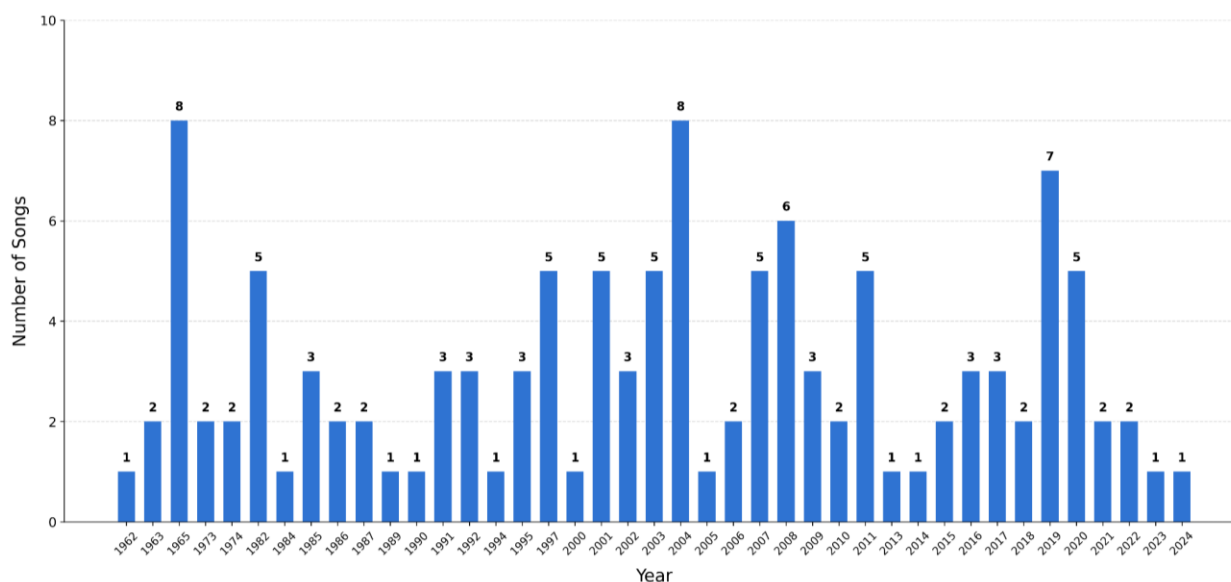

Most existing literature has focused on English translations of song lyrics, However, direct work on Urdu text remains limited. Urdu presents unique challenges because of its morphological complexity, right-to-left script, and it's borrowing of words from various languages, which reduces the accuracy of standard English NLP systems. Riaz (2007) pointed out that Urdu lacks sufficient processing resources which has been confirmed by Sarwar et al. (2018) as well. They showed that sentiment analysis and theme detection tools for Urdu are not developed as much as in English and even other South Asian languages like Hindi. Although there are large language models built for Urdu text processing like QALBi, multilingual BERT models, but they are not specifically trained for song lyrics and they require high computation. Even in non-English contexts, such as

Greek songs, Logothetis, Michalopoulos and Papaioannou (2022), translated Greek lyrics into English before conducting their NLP analysis, though with a sacrifice of some cultural subtlety. A similar issue appeared in Chinese lyrics because of the lack of robustness in Chinese NLP tools, Hu et al. (2009) created a manual Chinese lyrics dictionary to recognize stable emotional themes in a large set of Chinese lyrics. Of course, similar manual lexicon methods have worked well for Arabic songs, Hindi film songs, and Persian poetry, all of which are morphologically rich languages for which pre-trained models don't work as well.

3 Data

The dataset was designed by manually collecting Urdu lyrics from Pakistani patriotic songs, published from 1962 to 2024, with the aim of investigating the variation of musical themes over the years with respect to the corresponding macroeconomic conditions. Lyrics were retrieved from various sources such as official archives, music streaming platforms and publicly accessible lyric databases. Patriotic nature of each song was confirmed and then each song was classified into years and form of government. Some songs were in different languages, thus only the Urdu versions were selected to ensure consistency across the songs.

3.1 Data Preprocessing

The main challenge in analyzing lyrics was converting them into a form that could be measured quantitatively. First, collection of songs was done, and their lyrics were compiled. Since the study focuses on Urdu patriotic songs, the lyrics were carefully checked to ensure they matched the original songs. We had to make sure songs were in Urdu as our study was only for Urdu patriotic

songs. Verification was done by listening to the songs on YouTube (ISPR channel) and comparing them with the written lyrics. In cases where songs or verses were repeated, only the original lyrics were kept to avoid duplication. The lyrics were then organized by relevant time period, as the study examines their relationship with macroeconomic factors and the form of government. After cleaning the data, the lyrics were converted into .txt files for processing. Python was then used in the following steps:

3.1.1 Script Normalization

All characters were normalized to a single consistent encoding to prevent the same word from being missed due to script variation.

3.1.2 Punctuation and Special Character Removal

Urdu punctuation marks including the comma (‘), question mark(؟), and full stop(-) were removed. Spacing characters and zero-width joiners were also stripped.

3.1.3 Whitespace Tokenization

Lyrics were split into individual word tokens on whitespace boundaries, producing a list of candidate words for dictionary matching.

3.1.4 Stop-word Handling

Commonly words in Urdu prepositions, conjunctions, and pronouns were not removed from the corpus. Because the dictionary matching is theme-specific, non-thematic words simply produce zero matches and do not inflate scores.

3.1.5 Word Boundary Matching

A critical preprocessing decision specific to this project — standard substring matching was replaced with regex word boundary matching to prevent partial matches.

3.1.6 Proportional Splitting for Cross-Theme Words

Where a word appears in more than one thematic category in the dictionary, each theme receives a weight of $1/N$ per occurrence rather than a full count, preventing double-counting across the 8 regression dependent variables.

3.1.7 No Stemming or Lemmatization

Unlike English NLP pipelines, Urdu stemmers do not exist for poetic registers of the language. Instead, both root forms and inflected variants of key words were included directly in the dictionary

3.2 Dictionary Construction

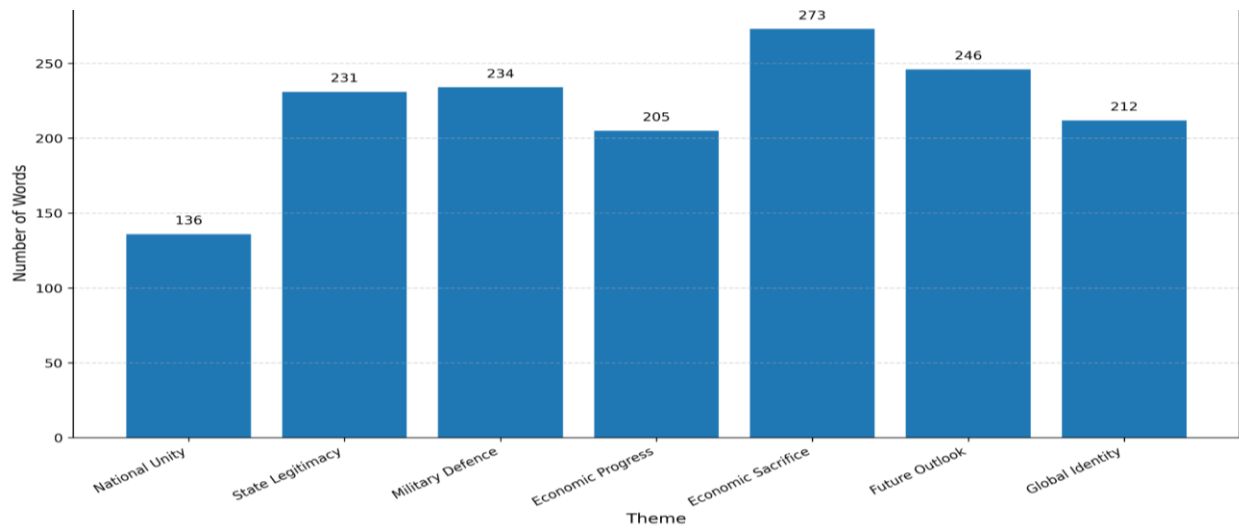

We used a dictionary-based approach to sort Urdu patriotic lyrics into measurable themes. Since Urdu NLP tools are still limited and most automated models are made for English, a manual dictionary was more suitable. Recent literature shows that analyzing Urdu text often requires language-specific resources and manual adjustments because word meanings depend on vocabulary, grammar, and context. (Sehar et al., 2023) So, instead of using a fully automated NLP model, we created a thematic Urdu dictionary for analyzing the lyrics.

The dictionary was constructed through a multi-step process. After converting song lyrics into text format. A large language model was then employed to create an initial set of Urdu words for each theme. This list was compiled by an Urdu subject expert and refined for accuracy and relevance to patriotic songs. Words that appeared frequently and relevant to the lyrics were added to the dictionary, while the weak, repeated, and ambiguous words were removed during the processing of lyrics. The final dictionary comprised approximately 1,000 Urdu words, organized into six themes. The lyric files were processed using Python to count how many times each word in the dictionary appeared in each of the songs, thus converting the songs' content into measurable data.

Urdu words are categorized across the following seven themes:

- National Unity and Social Cohesion
- State Legitimacy and Political Ideology
- Military Defense and Martyrdom
- Economic Progress and Resource Wealth
- Economic Sacrifice and Resilience
- Future Outlook and Youth
- Global Identity and Diaspora

Figure 2: Dictionary words by themes

3.3 Control Variables

1. **GDP Growth Rate:** This variable measures the annual rate of economic growth. Periods of economic expansion are expected to be associated with themes of progress in songs, whereas economic contraction is likely to correspond with themes of hardship. Annual data were obtained from the World Bank.
2. **Inflation Rate:** This variable captures the increase in prices of everyday goods over time. High inflation reduces household incomes and generates economic stress across society. Periods of elevated inflation are expected to shift song themes toward sacrifice and

resilience. Annual Consumer Price Index (CPI) data were sourced from the World Bank and the State Bank of Pakistan.

3. **Interest Rate:** This variable indicates the cost of borrowing in the economy. Elevated interest rates reflect tight monetary conditions and fiscal pressure. This measure is included to capture periods of austerity and International Monetary Fund (IMF) program conditionality in Pakistan. Annual data were obtained from the World Bank.
4. **Unemployment Rate:** This variable measures the proportion of individuals without employment. High unemployment is indicative of adverse economic conditions and social distress. It is anticipated that higher unemployment rates will reduce optimistic themes in songs and increase themes related to struggle and endurance. Annual data were sourced from the World Bank and the Pakistan Bureau of Statistics.

4 Methodology

The first step in methodology was to quantify the Urdu lyrics by employing a bag-of-words based scoring system to produce theme scores. For each song, the frequency of each dictionary word was counted and multiplied by its assigned theme weight. Words that appeared in only single theme were assigned a weight of 1, For words that occur in more than one theme, the weight was distributed evenly across all themes, so that each occurrence of the word counts equally. The weighted word frequencies were then added up to obtain a theme score for each song, which reflects the prominence of each theme in the song.

4.1 Empirical Model and Estimation

4.1.1 Lexicon Based Theme Scoring

The theme score for song i and theme k is calculated as:

$$S_{ik} = \sum_j (f_{ij} \times w_{jk})$$

Where:

S_{ik} is score of song i for theme k , f_{ij} is frequency of word j in song i , w_{jk} is weight of word j in theme k

The weight is defined as:

$$w_{jk} = 1/N$$

Where:

N is the number of themes word j appears in, If word appears in only one theme, $w_{jk} = 1$, If word appears in two themes, $w_{jk} = 0.5$ for each, If word appears in three themes, $w_{jk} = 0.33$ for each

In the second step, the theme scores were used as dependent variables in regression models. To determine whether there was any relationship between macroeconomic and political factors with the changes in the lyrics, separate regressions were conducted for each theme. The explanatory variables included log GDP, inflation, unemployment, type of government, and indicators for major national events. This enabled us to check if the themes of patriotic songs changed according to the economic, political system or periods after the crisis.

4.2 Regression Equation

$$\text{Theme}_{it} = \beta_0 + \beta_1 \log(\text{GDP}_t) + \beta_2 \text{Inflation}_t + \beta_3 \text{Unemployment}_t + \beta_4 \text{Democracy}_t + \beta_5 \text{Post65}_t + \beta_6 \text{Post71}_t + \beta_7 \text{Post77}_t + \beta_8 \text{Post99}_t + \varepsilon_{it}$$

Where:

Theme_{it} is word count score for song *i* in year *t*, **log(GDP)_t** is log of GDP in year *t*, **Inflation_t** is inflation rate in year *t*, **Unemployment_t** is unemployment rate in year *t*, **Democracy_t** is 1 if democratic government, 0 otherwise, **Post65_t** is dummy for post-1965 period, **Post71_t** is dummy for post-1971 period, **Post77_t** is dummy for post-1977 period, **Post99_t** is dummy for post-1999 period, **ε_{it}** is error term.

Six separate regressions were run, one for each theme, because each theme is a separate dependent variable. The objective was to test whether relationships exist between economic conditions and thematic content in patriotic songs over time.

To study how major economic events affect song themes, Dummy variables were used for four important events in Pakistan to study the impact of the major events on song themes. Post65 refers to the time following the 1965 India-Pakistan war which had a significant impact on military and

martyrdom themes. Some of the post-71 events such as the war of 1971 and the separation of East Pakistan are covered in the post71 section, while the post77 section is dedicated to the coming of military dictatorship and Islamization of political and cultural discourse by Zia ul Haq, which in turn affected the ideology of state sponsored music. Post99 was used in reference to the Musharraf coup, and the political turmoil that ensued. A democracy dummy was also added to distinguish the periods of democratic rule from military rule, and to test whether the kind of regime has some influence on song themes beyond that which economic factors can account for

5 Results

The findings answer the question of whether the economic and political situation has an impact on the themes of patriotic songs over time. The thematic categories were originally: National Unity & Social Cohesion, State Legitimacy & Political Ideology, Military Defense & Martyrdom, Economic Progress & Resource Wealth, Economic Sacrifice & Resilience, Future Outlook & Youth, and Global Identity & Diaspora. As the two economic themes were highly related in concept, they were merged into the larger theme Economic Development & Resilience. This is a blended category that encompasses both the spirit of economic development, and the language of sacrifice, hardship and endurance of the nation.

Data was aggregated at an annual level prior to running the regression. This implies that all songs from the same year were aggregated together, whereas yearly macroeconomic and political determinants (GDP, inflation, unemployment, democracy and political-period dummies) were retained at their annual level. This was particularly relevant because all three of the year-level variables, inflation, unemployment and GDP, should not be totalled across songs.

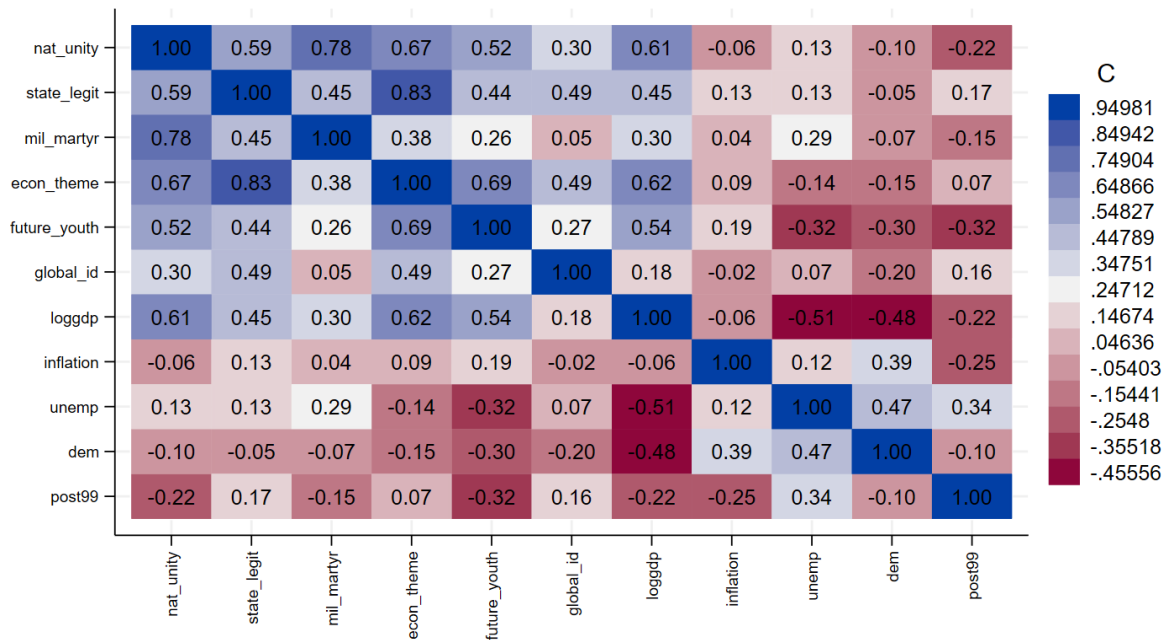

5.1 Correlation Results

Prior to adding the regression controls, the correlation matrix provides a preliminary idea of how the themes in the patriotic song change together. The best correlations are between the thematic variables, indicating that patriotic songs frequently employ more than one type of national message. For example, the state relationship with legitimacy and the political ideology has a positive correlation of 0.83. This also implies that songs that focus on the state or political ideology also typically focus on economic themes of development, sacrifice or national strength as well.

In the same vein, National Unity & Social Cohesion has a correlation of 0.78 with Military Defense & Martyrdom. So, in the context of defense and sacrifice and martyrdom, these ideas are coupled

to the idea of National Unity. Economic Development & Resilience is related to Future Outlook & Youth at 0.69. The themes of economic development and resilience, therefore, are often linked to hope for the future and youth, as in these lyrics. Themes are not unrelated from each other, but are parts of a larger vocabulary of patriotism.

Figure 4: Correlation Matrix

Source: Author's contribution

The heatmap visually supports the same pattern. The darker positive cells in the heatmap indicate the strong correlation among the main theme variables and most of the lyrical categories. Log GDP positively correlates with National Unity & Social Cohesion at 0.61, Economic Development & Resilience at 0.62, and Future Outlook & Youth at 0.54. It implies that with the increase in economic output, it is more likely that patriotic songs will articulate themes of national unity, development, and future. However, correlation is not causation. Hence, the results of the regression are relied upon to explore the nature of these relationships more closely.

The post-1965, post-1971, and post-1977 political dummy variables were considered for their significance to the major wars and political changes in Pakistan. However, they were excluded from the final regression due to multicollinearity. The large overlap between these and the collapsed annual dataset meant that Stata could not reliably distinguish between them. Thus, the final model retains post99 as the main post-1999 political change and democracy as the political context control in the model.

5.2 Regression Results

Table 1: Regression Output

VARIABLES	National Unity	State Legitimacy	Military Defense & Martyrdom	Economic & Development & Resilience	Future Outlook & Youth	Global Identity & Diaspora
Economic Variables						
Log (GDP)	0.378*** (0.063)	0.188*** (0.051)	0.195** (0.078)	0.292*** (0.068)	0.107* (0.055)	0.052 (0.058)
Inflation	-0.740 (0.576)	0.428 (0.470)	-0.062 (0.709)	0.491 (0.618)	0.654 (0.503)	0.187 (0.531)
Unemployment	6.356*** (1.475)	1.907 (1.204)	6.467*** (1.817)	0.598 (1.585)	0.211 (1.289)	1.178 (1.362)
Political Variables						
Post 1999	-14.286** (6.851)	8.090 (5.590)	-14.177 (8.435)	11.760 (7.361)	-6.179 (5.987)	3.413 (6.326)

Democracy	2.018	2.686	-8.121	6.459	-6.046	-5.008
	(6.760)	(5.516)	(8.323)	(7.263)	(5.907)	(6.242)
Constant	-3.535	-17.530*	3.460	-21.038	11.699	2.201
	(11.502)	(9.385)	(14.162)	(12.359)	(10.052)	(10.621)

Model Fit						
AIC	215.625	204.644	226.896	219.506	208.348	211.323
BIC	223.400	212.419	234.635	227.281	216.123	219.098
Observations	27	27	27	27	27	27
R-squared	0.698	0.441	0.439	0.508	0.390	0.121

Standard errors in parentheses. *** p<0.01, ** p<0.05, * p<0.1.

Note: Post-1965, post-1971, and post-1977 dummies were tested but excluded from the final specification because they were omitted due to multicollinearity in the collapsed annual dataset.

The regression models use each patriotic theme as a dependent variable. The explanatory variables include logGDP, inflation, unemployment, post99, and democracy. Overall, the results deduce that log GDP is the most consistent predictor across the theme categories, while inflation and democracy comparatively are not statistically significant.

For National Unity & Social Cohesion, the entire model is statistically significant with an R-squared of 0.698. The model captures roughly 69.8% of the variability of themes of national unity. Log GDP has a positive and statistically significant coefficient of 0.378 with a p-value of 0.000. Higher levels of economic output correlate with an increase in national unity of patriotic songs. Unemployment is also positive and significant, with a coefficient of 6.356 and a p-value of 0.000, suggesting that in years of higher unemployment, the patriotic songs may contain stronger appeals

for unity and cohesion. The post-1999 dummy is negative and significant with a coefficient of -14.286 and a p-value of 0.049, indicating a decrease of national unity songs after 1999, with other variables remaining unchanged. In this model, Inflation and democracy are statistically insignificant.

For State Legitimacy & Political Ideology, the model is also statistically significant, with an R-squared of 0.441. Log GDP is also significant and positive, with a coefficient of 0.188 and p-value 0.001. This suggests that years with higher economic output are likely to have stronger references to state legitimacy or political ideology in patriotic songs. However, inflation, unemployment, post99, and democracy are not significant. This indicates that state legitimacy is likely to be more connected to references of broader economic output rather than the short-term economic pressures or regime type in this model.

The regression for Military Defense & Martyrdom is statistically significant overall, with an R-squared of 0.439. Log GDP is significant and positive, with a coefficient of 0.195 and p-value of 0.020. Unemployment is also significant and positive, with a coefficient of 6.467 and p-value of 0.002. This finding is significant because it suggests that military and martyrdom themes become stronger with higher economic output and also with labor-market stress. Inflation, post99, and democracy are not significant. Although the negative post99 coefficient is interesting, since it is not significant in the 5% level, it is not meaningful.

For Economic Development & Resilience, the model is significant and explains about 50.8% of the variation in the theme. Log GDP is the only statistically significant predictor, with a coefficient of 0.292 and a p-value of 0.000. This is consistent with the nature of the theme itself, since the category directly captures economic progress, resource strength, sacrifice, and resilience. The positive coefficient suggests that as economic output increases, patriotic songs are more likely to

include economic language. Inflation, unemployment, post99, and democracy are not statistically significant in this model.

For Future Outlook & Youth, the model is less strong overall but $p = 0.0498$, $R^2 = 0.390$ are still significant. Log GDP has a positive coefficient (0.107), but since $p = 0.066$ it is only marginally significant. Thus, there is a weak model to say that economic output has a positive effect on future/youth themes. Inflation, unemployment, post99, and democracy have no significance. This could mean that themes of future and youth are more related to cultural/societal issues that are not captured in the more available economic and political issues.

The weakest results are for Global Identity & Diaspora. The model is not significant at $p = 0.717$ and $R^2 = 0.121$, and the explanatory variables are all statistically insignificant. Thus, log GDP, inflation, unemployment, democracy, and the post-1999 political shift have no bearing on Global Identity & Diaspora. These issues may be affected by a plethora of issues including, but not limited to, migration, international/global media and engagement, foreign relations, and cultural globalization.

The regression analyses show that log GDP is the most reliable consistent variable throughout the models. It is positive and statistically significant for National Unity & Social Cohesion, State Legitimacy & Political Ideology, Military Defense & Martyrdom, and Economic Development & Resilience. It is positive but marginally significant for Future Outlook & Youth. This suggests that GDP growth relates to the more extensive and frequent employment of patriotic lyrics.

Unemployment is significant for the National Unity & Social Cohesion and Military Defense & Martyrdom models. This may indicate that, when the economy is struggling, more emphasis may be placed on lyrics describing sacrifice and strength of the nation. Unlike unemployment, inflation

is not significant in any of the models. Similar to inflation, Democracy is not significant, which indicates that whether a year was democratic or non-democratic explains very little of the lyrics in this dataset.

The post-1999 dummy is significant only in the National Unity & Social Cohesion model and has a negative effect. This means that after 1999, the references to national unity, when all other economic variables and democracy are considered, decreased. However, since post99 is not significant in the other models, the negative effect appears to be limited to only one thematic model as opposed to all the themes.

To conclude, the results indicate that the patriotic song theme is more strongly linked with the economy than with inflation, democracy, or the political dummy variable since 1999. National unity, state legitimacy, military/martyrdom and economic development themes have more explicit connections with log GDP, and global identity does not seem to be well explained by the variables in the model. The dummies for the periods before 1965, before 1971 and before 1977 are also missing, which illustrates the challenges of distinguishing between overlapping political eras in a narrow annual time series. So the results should be interpreted as indicative of association and not causation.

6 Limitations

There are a couple limitations to consider in the interpretation of results from this study. Firstly, the data set is reduced in size once the songs are collapsed at the yearly level. This is why regression can be helpful in seeing large patterns, but also must be interpreted with care, and not as causal statements.

Secondly, the analysis is limited to selected patriotic songs, so it is not representative of all that was going on in the country during that time. Nationalism, politics, war and economic change can happen differently to people in different regions, classes, languages and cultural settings. A national-level song dataset can reveal one aspect of public expressions of patriotic song, but not all aspects of local, regional, or niche musical traditions.

The other limitation is that the study is based on thematic word counts. While it does measure the words, it can fail to capture nuances like meaning, metaphor, tone, and even emotion in the way the words are uttered. Others might say that there is no explicit mention of the lyrics, where some of the patriotic messages are conveyed in imagery, style of performance, melody and even by cultural reference.

Multiple collinear data was also a problem with some of the historic dummy variables. In the initial design, `post65`, `post71` and `post77` were added due to their being important political and war events in Pakistan's history. When combined into an annual series, however, they were highly correlated with each other, and neither was included in the regression. For this reason, `post-1999` and `democracy` remain as key political restrictions in the final model.

Last but not least, the study does not adequately reflect the diversity in cultural music in Pakistan. More regional, cultural and niche songs should be added to the future research, particularly songs

in different languages and different provinces. This would help indicate if there is any variation other than the national level, in respect of patriotic themes across communities.

7 Conclusion

This study aimed to find out the relationships of the themes of nationalistic songs with the economic and political condition of Pakistan during the past few decades. The key themes were: National Unity and Social Cohesion, State Legitimacy and Political ideology, Military Defense and Martyrdom, Economic Development and Resilience, Future Outlook and Youth, Global Identity and Diaspora. The two themes that covered the economy, Economic Progress and Resource Wealth and Economic Sacrifice and Resilience were merged into a single theme, Economic Development and Resilience because both spoke to the economic imagination of the nation, in its experience of economic progress, and of pain and struggle with collective resilience.

The correlation results depict that several patriotic themes are correlated. Thus, for instance, the theme of national unity is tightly linked with the themes of the military and martyrdom, and the theme of state legitimacy is tightly linked with the theme of economic development and resilience. That is, it indicates that patriotic songs tend to fuse multiple aspects of one's nationhood together instead of singling them out. A story on unity can also be a story of sacrifice, ideology of the state, hope for economy.

The results from the regression analysis suggest that of all the predictors in the models, log GDP consistently occurs the most. Positive and significant associations were found with National Unity and Social Cohesion, State Legitimacy and Political Ideology, Military Defense and Martyrdom and Economic Development and Resilience. This may mean that years with a higher economic output most often correlate with the stronger patriotic themes in songs.

Unemployment plays an important role in the National Unity and Military/Martyrdom models as well. This could suggest that in times of economic hardship, lyrics are more focused on unity,

strength, sacrifice and defense of the nation. However, Inflation does not account for a significant factor in the models. Democracy also does not appear as a strong predictor, which suggests that patriotic song themes are not explained simply by whether the country was under a democratic or non-democratic period.

The post-1999 dummy is significant only in the National Unity model, where it has a negative relationship. This suggests that national unity themes declined after 1999 when other variables are controlled for, although this effect does not appear across all themes.

Overall, the study claims that apart from political history, economic conditions and the general mood of the country also shape the context of patriotic songs. Economic performance seems to be particularly relevant in this context to understand the emergence of multiple patriotic themes. Nevertheless, the findings should be conceived as general patterns and not as comprehensive explanations of the society of Pakistan. To understand this better, one would have to analyze songs from different regions, cultural music, diverse and niche genres and the lived experiences and realities of different communities across the vast and diverse country.
